

Making  
waste  
work.

# Energy Independence

ENERGY INDEPENDENCE - WASTE TREATMENT SOLUTIONS

- + Avoid increasing energy prices
- + Maintain energy independence
- + Treat waste on site
- + Build valuable revenue streams

Biogas plants are a great way for producers to generate energy on-site utilising their organic waste.

Biogas plants are one of the only sources of renewable energy which can cost-effectively provide baseload power to offset grid demand, without the need for costly battery storage.

This means you can be confident that a plant will supply your needs 24/7, without the need to worry about the wind blowing, or the sun shining.

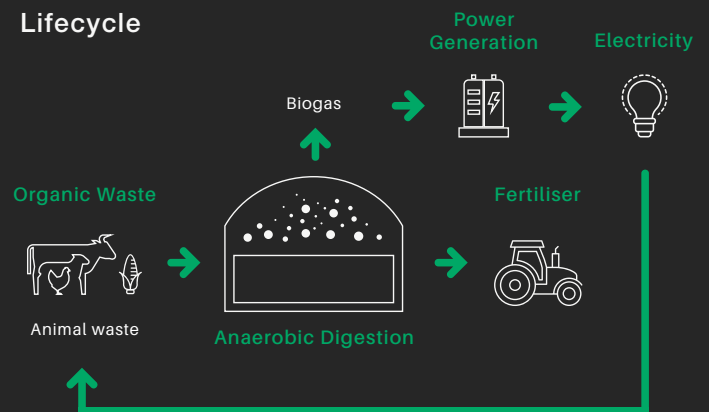

Biogas plants are a proven, cost-competitive way to treat waste on-site and recover energy and valuable by-products.

Making waste work.

## Peace of mind

You can be confident that a plant will supply your needs 24/7, without the need to worry about the wind blowing, or the sun shining

### Lifecycle

## Energy Independence

Having control over your own decentralised energy generation asset provides a shield from increasing energy prices, network stability issues and access to energy; and the sale of by-products from the digestion process (biogas plant) can provide valuable revenue streams to your business to help drive down input costs.
